| (54) Title: OLIGOPEPTIDIC INHIBITORS OF ELASTASES AND METHODS OF PREPARATION THEREOF | | |
| (57) Abstract <p>The invention relates to oligopeptidic inhibitors of elastases, with potent inhibition of leukocyte elastase. The inhibitors are isobutylamides of tetra- to pentapeptides which have substituted lysine incorporated in the N-terminal portion of the molecule. This dibasic amino acid is alternatively substituted at both α- and ϵ-aminogroups with higher saturated acids or with ω-carboxylalkanoylic residues. In one type of these compounds the ϵ-aminogroup is acylated with an acyl-alanine, where an acyl means a higher saturated acid. The compounds of this invention are the active components of medicinal preparations used mainly in dental practice.</p> | | |
